

Re: H8100 Series Energy Meters

To meet the market needs for a rugged and reliable instrument, the H8100 Series Energy Meter is factory calibrated, and therefore, does not need field calibration and does not provide a means to do field calibration. As such, a calibration interval is not required for this product.

This product is calibrated at multiple voltage, current, and other points, using a NIST traceable Cal Instruments model 4500iC AC power source, a Square D CM4000 meter meeting ANSI C12.20 0.2%, an HP34401, and other equipment.

The H8100 Series Energy Meter is offered with a standard warranty covering construction & performance. At the end of the warranty period, you may return the product to Veris Industries for performance verification.
