

Removing DBServer installation type.

During the development of PME 8.2 the Database Server installation type was discontinued. During a distributed upgrade to 8.2 it is no longer necessary to run 8.2 installer on the database server. Unfortunately, artifacts of previous installation are still present on the database server and running these components may alter the existing PME database in a way that breaks functionality. Furthermore, uninstalling these previous versions may also result in undesired behavior such as detaching PME databases and corrupting report subscriptions.

An alternate EverythingElse.broker.xml file has been crafted to allow for the safe uninstallation of previous PME installations. This broker allows the uninstallation to proceed without detaching the ION databases or deleting report subscriptions. To use this modified broker it needs to be copied to the **“Uninst_PowerMonitoringExpert\BrokerFragments”** folder typically located in **“C:\Program Files (x86)\Schneider Electric\Power Monitoring Expert”**. This file should overwrite the existing file.

After copying the file PME uninstalled through the Windows Programs and Features app as normal.
