Introduction

The PowerLogic™ High Density Metering System is used to monitor the amount of electricity used in individual units of multi-unit residential or commercial buildings. The system consists of one or more power meters housed in a wall-mounted metal cabinet or enclosure. Multiple enclosures may be installed at a single location.

A meter is assigned to a tenant who occupies an individual unit within a complex. The meter monitors and records the energy consumed inside the unit. At pre-determined times, tenant billing software polls the meter through a communications link to gather usage information. This information can be used as a means of monitoring overall electrical usage or to generate an electric bill for the tenant.

NOTE: Some locations/jurisdictions do not permit sub-billing. Before billing tenants, check your location/jurisdiction regarding regulations.

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA, CSA Z462 or applicable local standards.
- Turn off all power supplying this device and the equipment in which it is installed before working on the device or equipment.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Do not exceed the device's ratings for maximum limits.
- Do not use this device for critical control or protection applications where human or equipment safety relies on the operation of the control circuit.
- Replace all devices, doors and covers before turning on power to this equipment.
- Do not alter factory-installed wiring inside the enclosure.
- Replace front bonding screw before applying power to the device.

Failure to follow these instructions will result in death or serious injury.

The 1-meter enclosure is available in two configurations (see Figure 1 and Figure 2). The Type 1 configuration is intended only for indoor use. It has a clear viewing window in the door, but does not have a rain hood. The Type 3R configuration is intended only for outdoor use. It has a rain hood, but does not have a viewing window in the door. Both enclosures feature a hasp to lock or seal the door.

Figure-1: Meter Enclosure - Type 1 Assembly

The meter, interior components, and wiring connections are covered by a protective, removable, exterior case. To access the interior, remove the case from the supporting base/backplate (see Figure 3). The meter is positioned on a supporting bracket attached to the base/backplate that swivels outward to allow access to the back of the meter and terminals for field wiring. The bracket has a small locking feature to hold the door open in the 90° position. The bracket can be swiveled out by lifting up slightly and out from the left side.

The following steps summarize the installation:

1. Unpack and verify the box contents.
2. Remove the front bonding screw.
3. Lift the case off.
4. Remove the appropriate knock outs.
5. Mount the enclosure.
6. Make the voltage, current, and communications connections.
7. Replace the cover.

Figure–2: Meter Enclosure - Type 3R Assembly

To remove the case, complete these steps:

1. Open the door.
2. Remove the front bonding screw.
3. Lift the case up and out to slide it off the base/backplate.
4. Swing the supporting bracket and meter around to the side.

To re-install the case, reverse the steps.

Figure-3: Case Removal

Mounting the Enclosure

Mount the metering enclosure next to the distribution panelboard that serves the load to be monitored.

The recommended clearances for the installed enclosure are shown in the Figure 4 below.

Figure-4: Recommended Enclosure Clearances

Drilling will produce metal shavings that may fall into vents, reduce spacings, and possibly create electrical short circuits.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

Do not drill into the enclosure.

Failure to follow these instructions will result in death or serious injury.

Four (4) pre-drilled 0.32-inch/8.1-mm holes are provided on the backplane of the enclosure for mounting. Use #10 or up to 5/16-inch screws, with washers as needed, to attach the enclosure to the wall. Always mount with four (4) screws. Figure 5 shows the pre-drilled mounting holes and knockout points for the electrical conduit.

DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Apply appropriate personal protective equipment (PPE) and follow safe electrical work practices. See NFPA 70E in the USA, CSA Z462 or applicable local standards.
- Turn off all power supplying this device and the equipment in which it is installed before working on the device or equipment.
- Always use a properly rated voltage sensing device to confirm that all power is off.
- Do not exceed the device's ratings for maximum limits.
- Do not use this device for critical control or protection applications where human or equipment safety relies on the operation of the control circuit.
- Never short the secondary of a voltage transformer (VT).
- Never open circuit a current transformer (CT).
- Always use grounded external CTs for current inputs.
- Replace all devices, doors and covers before turning on power to this equipment.
- Do not alter factory-installed wiring inside the enclosure.
- Replace front bonding screw before applying power to the device.
- Provide overcurrent protection external to the enclosure on control power and voltage measurement inputs.
- Before energizing enclosure, all unused spaces must be filled with blank covers.
- Do not loosen slider screws.

Failure to follow these instructions will result in death or serious injury.

Conduit knockouts are provided on the enclosure (see Figure 5 on page 12).

To comply with national and local standards, Class 1 (voltage input) wiring must be kept separate from Class 2 (current transformer and communications) wiring. Refer to NEC code and local codes before installing.

NOTE: Conduit hubs shall be rated to the same weather rating as the enclosure and must comply with the standard for Conduit, Tubing and Cable Fittings, UL 514B.

NOTE: Voltage inputs shall be connected to the load side of a Class CC, G, J, RK1, RK5, L or T 7A branch circuit fuse or inverse-time/instantaneous-trip circuit breaker. Use copper conductors only.

Table 4: Stripped Wire Terminal Specifications

Connection	Stripped Wire Length
Voltage	5/16 in (7.94 mm)
Ground	3/8 in (9.53 mm)
Comms	5/16 in (7.94 mm)
CT Shorting Block	3/8 in (9.53 mm)

Circuit Protection

Control power and voltage inputs require overcurrent protection external to the enclosure. The fuses/circuit breakers must be rated for the installation voltage and sized for the available

fault current. Voltage inputs must be connected to the load side of a Class CC, G, J, RK1, RK5, L or T 7A branch circuit fuse or inverse-time/instantaneous-trip circuit breaker. Use copper conductors only.

Shorting Block Use

See Figure 8 and follow the instructions below for using the shorting block.

Figure–8: Shorting Block Use

Removing Short from Current Inputs

To measure the energy from the circuit, you must remove the default short from the current inputs. To remove the short from the current inputs, complete these steps:

1. Turn OFF and tag out the main external breaker supplying this equipment before working on or inside it.
2. Use a properly rated voltage sensing device to confirm that all power is off.
3. Ensure field wiring leads from current transformers are securely connected to the shorting block.
4. Ensure wiring within the enclosure is securely connected to a metering device.
5. Loosen all four (4) shorting bar screws.
6. Slide the shorting bar away from the field connection screws or toward the top of the enclosure.
7. Tighten the left-most (GND) shorting bar screw.
8. Remove the tag from the main external breaker.
9. Energize the system.

Shorting the Current Inputs

By default, the current inputs are shorted when you receive the enclosure. To short the current inputs, complete these steps:

1. Turn OFF and tag out the main external breaker supplying this equipment before working on or inside this equipment.
2. Use a properly rated voltage sensing device to confirm that all power is off.
3. Loosen the four (4) shorting bar screws on the shorting block.
4. Slide the shorting bar toward the field connection screws or the bottom of the enclosure.
5. Tighten all four (4) shorting bar screws 6 ± 1 lb-in ($0.678 \text{ N}\cdot\text{m} \pm 0.1$).

Current Transformers

Field-installed current transformer (CT) leads require stripped wire terminal connections. Refer to Table 4 on page 15 for stripped wire specifications. The CT shorting block is shipped in the shorted position by default from the factory.

NOTE: Schneider Electric recommends metering class current transformers with 5 A secondary.

Voltage Input Connectors

Refer to Figure 9 for voltage input connections.

Figure–21: RS-485 Serial Modbus Connection

Initializing the Meters

The meter must be initialized before placing into service. For instructions on initializing, see the meter user guide shipped with the cabinet (also available at www.schneider-electric.com).

How to Upgrade Firmware

You can find meter firmware under Documents & Downloads on your meter's product page at www.schneider-electric.com.

Removing a Meter

If you need to remove the meter from the enclosure, a cover plate must be attached unless the meter is intermediately replaced with another. See "Cover Plates" on page 25.
